

Portfolio Intelligence Dashboard

Foundation Workflow Map

Folahan Williams · Funds Management & Technology · Thursday 18 June · Week 1

The frontend never computes fund math. The backend never handles presentation.

End-to-end flow

Where the data is fetched

File	Holds	Drives
holdings	shares, sector, region, currency	AUM, weights, exposure
prices	daily history (Nov last yr +)	returns, volatility, beta, VaR, drawdown
benchmark	index weights & returns (S&P tech)	active weights, Brinson attribution
fx	rates → USD	normalise every total to USD

Production swap: the loader is the only thing that touches raw data — mock CSVs → live feed (e.g. Finnhub) changes this one layer, nothing else.

Each screen section = one endpoint

Endpoint	Screen section	Shows
/summary	Portfolio Summary	AUM, P&L, total & active return, top contributors/detractors
/exposure	Sector & Geographic	weights, signed active weights, HHI / effective N, heatmap
/risk	Risk Metrics	volatility, beta, Sharpe, VaR 95/99, correlation, max drawdown
/attribution	Performance	MTD/QTD/YTD/1Y, contribution, Brinson alloc vs selection

What the manager sees

+-----+ PORTFOLIO INTELLIGENCE [Window: 1M v] [Filter: All v] +-----+			
AUM (USD)	Total Return	Active vs Benchmark	<- Summary
Top contributors ^ AAPL ^ MSFT	Top detractors	v NVDA v AMD	
+-----+			
SECTOR & GEOGRAPHIC EXPOSURE		RISK METRICS	
heatmap · active weights · HHI		vol · beta · Sharpe · VaR	
		drawdown · correlation	
+-----+			
PERFORMANCE ATTRIBUTION			
MTD QTD YTD 1Y · contribution · Brinson allocation vs selection
